Knowledge Discovery

Model Solution

The goal XXX this project is to forecast bike rental demand given the input feature like the duration of travel, departure location, arrival location, and time elapsed.

Evaluation metrics: RMSLE(Root Mean Squard Logarithmic Error) is required to evaluate the model.

$$RMSLE = \sqrt{\frac{1}{n}\sum_{i=1}^{n}\left[log(p_i+1)-log(\alpha_i+1)\right]^2}$$
 n is the number of test set samples, pi is the

n is the number of test set samples, pi is the test value, and ai is the actual value. When the root mean square error is smaller, it means that the fitting effect of the data is better and the test value is closer to the actual value.

Model Solution

You are provided hourly rental data spanning two years. For this competition, the training set is comprised of the first 19 days of each month, while the test set is the 20th to the end of the month. You must predict the total count of bikes rented during each hour111covered by the test set, using only information available prior to the rental

- train.csv It contains a training set of target variables.
- test.csv It does not contain a training set of target variables.
- sampleSubmission.csv It is a properly formatted sample submission file.

Knowledge Discovery

- datetime hourly date + timestamp
- season 1 = spring, 2 = summer, 3 = fall, 4 = winter
- holiday whether the day is considered a holiday
- workingday whether the day is neither a weekend nor holiday
- weather 1: Clear, Few clouds, Partly cloudy, Partly cloudy
 - 2: Mist + Cloudy, Mist + Broken clouds, Mist + Few clouds, Mist
 - 3: Light Snow, Light Rain + Thunderstorm + Scattered clouds, Light Rain + Scattered clouds
 - 4: Heavy Rain + Ice Pallets + Thunderstorm + Mist, Snow + Fog
- **temp** temperature in Celsius
- atemp "feels like" temperature in Celsius
- humidity relative humidity
- windspeed wind speed
- casual number of non-registered user rentals initiated
- registered number of registered user rentals initiated
- count number of total rentals

Model Solution

The random forest model will be used to fill the zero values in the windspeed feature.

Summary of RMSLE scores for the 16 models

	Model	RMSLE
15	LightGBM	0.316161
11	Random Forest Regressor	0.375379
10	BaggingRegressor	0.394187
14	XGBoost	0.422559
13	GBRT	0.435759
8	DecisionTreeRegressor	0.523695
9	ExtraTreeRegressor	0.554145
12	AdaBoostRegressor	0.697286
4	KernelRidge Regression	0.813210
7	KNN	0.864965
6	SVR	1.045943
5	ElasticNet Regression	1.053736
3	Ridge Regression	1.053749
2	Lasso Regression	1.054156
0	Linear Regression	1.054414
1	Logistic Regression	1.127804

Result

The best two models Stacking and LightGBM are weighted and the final prediction is saved.

ensemble = stacking_pred * 0.60 + lgb_pred * 0.40
